

Full Module View.

In this 2nd tray with holes only put food in order that the worm from the tray and let us rise above the vermicompost free in the first tray with holes, these steps are followed with the trays 3 and 4.

When the tray 4 is full of worms, we took the trays 1, 2 and 3 with the vermicompost. We are worms in there and have incorporated the tray 4 which is the tray where the process starts again.

MODULE HOME INSTRUCTIONS LOMBRICOL.COM

After the module home assembly LOMBRICOL.COM you must follow the following instructions explain step by step below:

Starting from the bottom up, put first the plastic tray with no holes, this will serve to periodically collect leachate generated. (This leachate can be applied as liquid fertilizer for plants in your garden without any problem).

View of the trays at the beginning of the process.

Above the tray placed a tray with holes that is where we planted the worms. From this moment begins the feeding of the worms.

When the first tray is filled with holes and see which food is converted into vermicompost, proceed to the second place on the tray with holes, one must bear in mind that this tray is well bonded to the substrate of the first tray with holes to allow free movement of earthworms from one tray to another without leaving the module.

PREPARATION FOOD

To prepare food must do the following:

- Use organic waste plants, vegetables, fruits, paper, cardboard, egg shells, etc..
- It is not advisable to use the remains of meals containing fat and salt.
- Do not give them any kind of meat (may smell bad).
- In a bucket with a lid you can chop and mix the waste before handing it to the worms.
- Let decompose for a period of 20 to 30 days.
- Is recommended to measure the pH and temperature before feeding the worms.
